PRASA CONNECT

Video walkthrough and evidence checklist

TARGET LENGTH	ABOUT 6 MINUTES	FORMAT
A focused app demonstration covering the implemented Part 2 and Part 3 workflows.	Keep each screen readable; pause briefly after important actions.	Record the real phone screen with clear narration. Avoid editing that hides errors.

Before you record

• Install the latest debug APK built from the PRASA worktree. Open it once and confirm it launches.

• Use a real phone, portrait orientation, steady screen brightness, and Do Not Disturb. Hide personal notifications and private email addresses.

• Prepare a test account and confirm email login works. Google sign-in was not yet verified on-device; do not include it unless you test it successfully first.

• Have a route, test booking, and harmless incident example ready. Do not claim the example timetable is an official live PRASA feed.

• Only demonstrate cloud sync, push delivery, or photo upload when you can show the operation succeeded in this recording. Never reveal passwords, tokens, service-account JSON, or personal data.

Suggested narration

"This is PRASA Connect, an Android passenger-support concept. I'll demonstrate account access, journey discovery and booking, a digital ticket, incident reporting, settings, and the app's online/offline behaviour. Timetable examples are academic sample data, not a live PRASA operational feed."

Recording plan

Use this sequence as a compact story: introduce the purpose, show that the app responds to real user actions, then demonstrate the evidence most relevant to the rubric.

TIME	SCREEN / ACTION	SHOW AND SAY
0:00-0:25	Opening / app launch	Show the PRASA Connect splash or sign-in screen. State the project goal: help commuters find journey information, manage bookings, and report service issues.
0:25-1:00	Register or sign in	Use a test account. Show field validation and successful entry to the app. Briefly mention Supabase Auth. Do not show credentials; skip Google unless its live flow has been tested.
1:00-1:35	Home dashboard	Point out the next-journey summary and the navigation to timetable, booking, tickets, alerts, profile, stations/map and reporting. Tap through at least one route.
1:35-2:10	Timetable / route search	Choose an origin and destination and show matching services, times, train IDs and platform details. Say clearly that displayed schedules are sample/academic data, not live operational data.
2:10-2:55	Booking and ticket	Confirm a test booking, then open My Tickets. Show the saved booking details and QR code. Explain that it represents an app booking record and is not an official PRASA travel ticket or proof of payment.
2:55-3:30	Map and stations	Open the Gauteng rail map and station information. Show that this is a reference map for route context, not live GPS train tracking.
3:30-4:10	Incident report	Submit a harmless test report with a short description. If image upload is enabled and verified, attach a non-sensitive test image. Show the confirmation or report history.
4:10-4:40	Alerts	Show the service-alert screen and notification preference. If a push alert was actually delivered to this phone, show it; otherwise describe push as configured but not demonstrated, rather than implying delivery.
4:40-5:10	Profile and settings	Show profile, language selection, notification and offline-sync settings, save changes, and return to confirm navigation remains usable.
5:10-5:50	Offline and sync evidence	If tested: turn on airplane mode, show cached/saved content or queue a report, restore connectivity and show sync completion without duplicates. If not tested, omit the claim and mark it for follow-up.
5:50-6:10	Close	Summarize the demonstrated workflows and name limitations honestly: sample schedules, no official ticket validation, and any integrations not tested on a physical device.

If time is short

Prioritize sign-in, a timetable search, booking plus ticket QR, incident submission, and a quick offline-sync proof. Keep the map, alerts, and settings sections brief, but include them if they are explicitly required by your rubric or proposal.

Evidence and recording checks

A good demo is a clear record of what actually happened. Keep the phone status/navigation bars visible when useful, and let success messages remain on screen long enough to read.

Before

Charge the phone; clean the screen; close unrelated apps; enable Do Not Disturb; confirm the app is the fresh build; sign in before recording if login confirmation would take too long.

During

Record one continuous take where possible. Tap slowly. Keep the app text legible. Narrate the action and result. If something fails, pause and retake that section instead of editing out a misleading outcome.

Show evidence

Where available, capture a successful booking record, ticket QR, report confirmation/history, saved settings, and visible offline queue/sync status. Include database/API evidence only if the assessment asks for it and no secrets or personal data are exposed.

Do not claim

Live train positions, official live timetables, real fare/payment processing, legally valid tickets, verified FCM delivery, production readiness, or tested Google SSO unless each was actually verified.

After

Review the whole video once. Check audio, legibility, and that it plays from start to finish. Use a clear filename such as PRASA_Connect_Demo_.mp4 and submit it using the lecturer's required platform and format.

Final checklist

[ ] App launches on the phone

[ ] Login/registration shown without exposing credentials

[ ] Core passenger flow shown from search to ticket

[ ] Incident reporting shown

[ ] Map/stations, alerts and settings covered

[ ] Offline sync and push claims match what was tested

[ ] Sample data and feature limitations stated honestly

[ ] Video reviewed and saved in the required format

This guide is a recording aid, not a certification that every hosted service or POE criterion has passed. Check the assessment rubric and your lecturer's submission instructions before recording.
